

PageRouter Pro Delivers, Within Seconds, Critical Alarms Triggered by PLCs and Machine Contacts

Canamex Communications announces the release of PageRouter Pro software with PageAlert, to deliver factory operation alarms to in-house pocket pagers carried by staff working in high-noise environments where traditional loudspeakers, strobes or two-way voice communication are not effective.

Markham, Ontario ([PRWEB](#)) July 17, 2013 -- PageRouter Pro can be connected to robotic controllers, factory PLC relays and machine contacts that can automatically trigger specific “intelligent” alarms programmed in PageRouter. You can immediately convey to your staff, the nature of the alarm and its location.

How important is it for your operations to reduce response time to specific factory alarms?

PageRouter Pro with PageAlert, can be used to monitor up to (96) PLC or machine contacts per each of its (12) sets. You can program specific text describing the alarm to be sent when closing or opening of a particular relay contact.

When a contact closes or opens, PageRouter Pro delivers a specific alarm, within seconds, to staff with Canamex’s mobile message receivers. The ALPHA 4 Gold looks like a traditional pager, but don’t be confused. There are no monthly usage fees – These alphanumeric receivers are part of the PageRouter Pro turnkey package that you buy, which have been designed for factory usage. They have a very strong vibrator to announce messages in high-noise environments, a very loud beep and they are UL “intrinsically safe” approved.

PageRouter Pro provides an interactive drag-and-drop map for alarm assignment flexibility. For example, for contact #1, program “Glass Oven 12 exceeds temperature”. Then, from a list of users, drag and drop the name of the person or of a Group of people responsible to respond to that alarm.

PageRouter Pro systems with PageAlert are already in operation at many factories in the USA, Canada and Mexico. Founded in 1978, Canamex Communications has a long history of developing high quality and reliable products that have contributed to the advancement of wireless delivery of critical messages.
